

Bandwidth Saving LV3 S2 IF Modem

OVERVIEW

The low cost **QUANTUM Series PD20** brings the *bandwidth saving* and *robust-ness* benefits of **DVB-S2** to traditional SCPC services such as IBS and Drop & Insert. In addition, **Paired Carrier** technology overlays transmit and receive carriers reducing satellite bandwidth by up to 50%. Paired CarrierTM technology is patented by Viasat Inc.

QUANTUM modems are fully backward compatible with Paradise Evolution modems when DVB-S2 and Paired Carrier are disabled.

SCPC features, DVB-S2 Space Segment

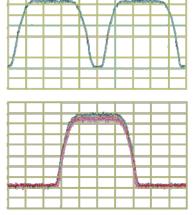

Modes of operation:

- DVB-S2 outbound with SCPC return, or SCPC outbound with DVB-S2 return.

Drop & Inse	ert Option Specifications
Parameter	QUANTUM Series Modem
Bearer Types	T1-D4, T1-ESF and E1-G.732
Timeslot Selection	Independent selection of arbitrary timeslots for both drop and insert.
Bearer Generation	The terrestrial bearer may be looped through the Drop Mux then Insert Mux, or terminated after the drop Mux and a new blank bearer generated by the insert Mux. The bearer generated within Insert Mux provides full multiframe and CRC support and may be generated from the Tx clock, station reference, satellite clock or internal reference.
Bearer Backup	In the event that insert Mux bearer clock is lost, or AIS is supplied, then Insert Mux will switch temporarily to bearer generation mode in order to preserve receive traffic. The backup bearer may be generated from the station reference, satellite clock or internal reference.
Terrestrial CRC	Fully supported, with front panel display of terrestrial error rate based on CRC (T1-ESF and G.732) or Frame Alignment Word errors (all bearer types).
Timeslot ID	The IBS/SMS or Closed Net Plus ESC overhead maintains the identity of individual Drop/Insert timeslots for N=1,2,3,4,5,6,8,10,12,15,16, 20, 24 and 30. (See extended option below).

Extended Drop & Insert Option Specifications			
Parameter	QUANTUM Series Modem		
Timeslot Re-Ordering	Selected timeslots may be independently re-ordered on both Tx and Rx paths.		
Multi-Destinational Working	All or only a subset of the received data may be inserted into the terrestrial bearer on the receive path for multi-destinational working.		
Timeslot ID Maintenance	The IBS/SMS or Closed Net Plus ESC is extended to maintain the identity of individual timeslots for all values of N from 1 to 31.		
Signalling	Both Channel Associated Signalling (CAS) and Robbed Bit Signalling (RBS) are fully supported. For G.732 Drop/Insert, CAS signalling is extracted from terrestrial TS16 and carried over the satellite in IBS/6MS TS16 and TS48 before re-inserting into the distant terrestrial TS16. For RBS, the IBS or Closed Net Plus ESC overheads maintain the identity of the in-band signalling and it is re-inserted into the terrestrial multi-frame in the correct positions to maintain the RBS.		

PARADISE DATACOM

Paired Carrier			
Parameter	QUANTUM Series Modem		
Paired Carrier	Transmit and receive carriers are overlaid on top of each other in the same space segment. Echo cancellation techniques are used in the demodulator to cancel the transmit carrier and extract the wanted receive carrier signal .		
Cancellation Bandwidth	Options available up to 2.5Msymbol/s, 5Msymbol/s and 10Msymbol/s.		

PAIRED CARRIER MODEM SCHEMATIC

Paired Carrier technology allows both the uplink and downlink signals to occupy the same space segment. An adaptive self-interference cancellation technique removes the uplink signal components generated by the local terminal from the received signal off satellite, allowing demodulation of the far end signal.

PD20 Satellite Modem

Ethernet Tr	affic
Parameter	QUANTUM Series Modem
Standard (unaccelerated)	Base modem will pass UDP to at least 5Mbps (subject to prevailing data rate limits enabled in the modem) and unaccelerated TCP to typically 128kbps per connection, subject to an overall packet handling limit of 10,000 packets per second.
PEP (TCP/IP acceleration) Option	Performance Enhancing Protocol (acceleration) for TCP/IP traffic - overcomes performance problems associated with TCP over satellite. Maximum throughput on the base Modem10Mbps.
Traffic mode	Bridging (standard) for point-to-point operation Brouting (Option) for point-to-multipoint and satellite outbound plus nonsatellite return. Mesh network support. User selectable bridge between Ethernet traffic and Ethernet M&C port.
DHCP	Dynamic Host Control Protocol allows modem IP address to be allocated dynamically from an external DHCP network server.
Ethernet Header Compression	Compression of Ethernet frame headers at data rates up to 2Mbps. Typically reduces 14 byte Ethernet header to 1 byte.
IEEE 802.1p/q	IEEE 802.1p Quality of Service supporting the choice of strict priority queuing or fair weighting queuing. IEEE 802.1q VLAN support
IP Traffic card & options	Optional Encapsulation of IP packets and Ethernet frames over DVB uses Multi Protocol Encalsulation (MPE), Ultra Lightweight Encapsulation (ULE) or super efficient Paradise eXtreme Encapsulation (PXE)protocols. Supports TCP acceleration with maximum throughput rates of 20Mbps, subject to compatible options in the host modem. Supports up to 5,000 concurrent TCP connections. Overcomes the inherent limitations of standard TCP/IP over satellite. Improves the bandwidth utilisation to approximately 90% of selected data rate, with acceleration on. Reduces the inefficiencies of the standard TCP slow start algorithm. Prevents unnecessary activation of TCP congestion control algorithm. Optional Robust Header Compression to RFC 3095 profile 2 (IP/IDDP). Typical reduction in header size for IP/IDP is from 28 bytes to between 1 & 3 bytes. 1-way packet handling limit of 29,000 packets per second. 2-way packet handling limit of 22,000 packets per second. Includes Ethernet header compression which typically reduces the 14 byte Ethernet header to 1 byte. Dual RJ45 ports support 10/10/1000 BaseT Ethernet. Improves security by separating IP Traffic from Ethernet remote M&C on chassis.
